

Implementing a new Crypto Algorithm – Mysty1

Software Recommended: NetSim Standard v12.0 (32/64-bit), Visual Studio 2017/2019, Wireshark

Follow the instructions specified in the following link to clone/download the project folder from GitHub using Visual Studio:

<https://tetcos.freshdesk.com/support/solutions/articles/14000099351-how-to-clone-netsim-file-exchange-project-repositories-from-github->

Other tools such as GitHub Desktop, SVN Client, Sourcetree, Git from the command line, or any client you like to clone the Git repository.

Note: It is recommended not to download the project as an archive (compressed zip) to avoid incompatibility while importing workspaces into NetSim.

Secure URL for the GitHub repository:

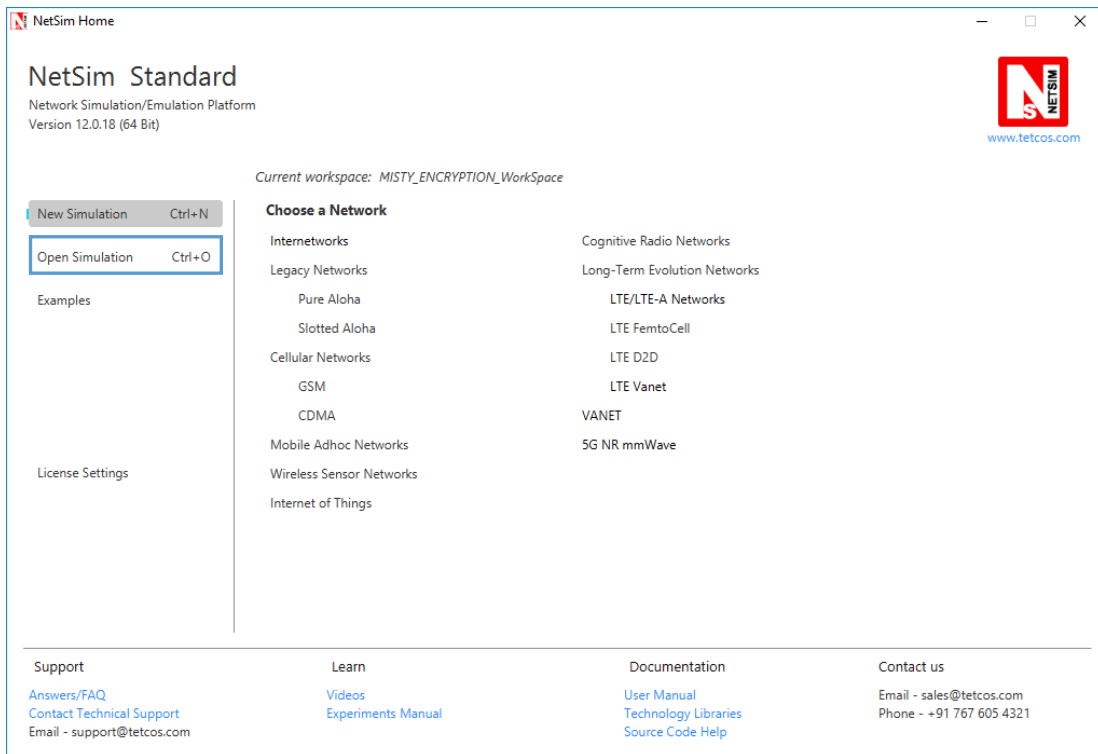

https://github.com/NetSim-TETCOS/MISTY_ENCRYPTION_v12.0.git

In NetSim the packet payload in the application layer can be encrypted optionally using the inbuilt encryption models such as AES, DES, XOR and TEA algorithms. However, users can also implement their own encryption algorithms. In this project we have attempted to implement Mysty1 encryption algorithm in NetSim encrypt the packet payload.

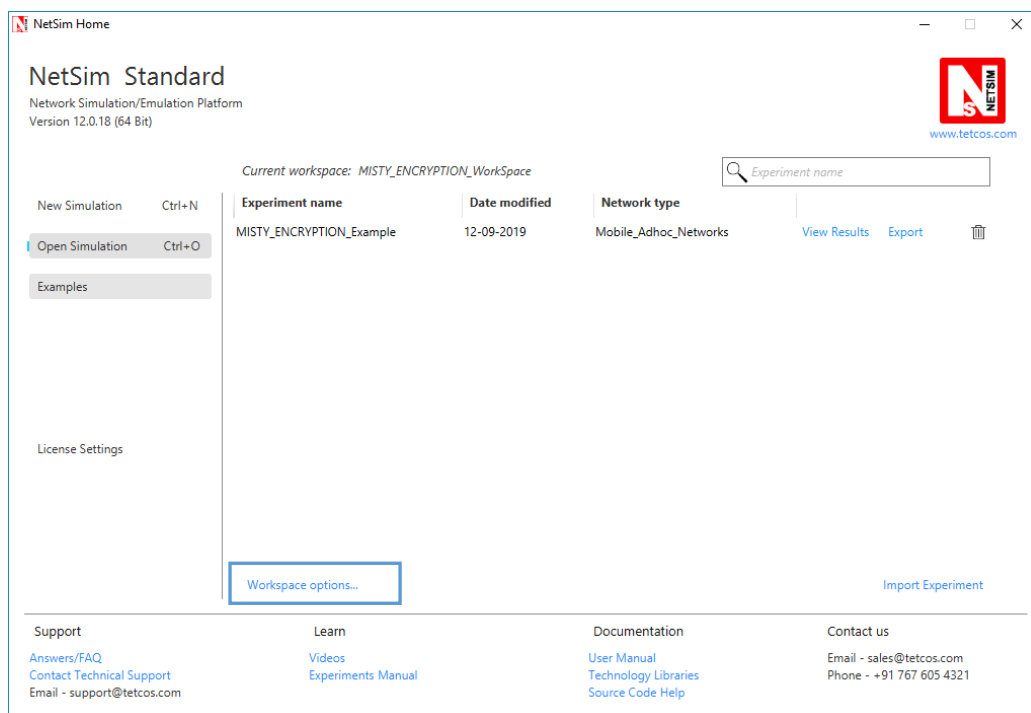

MISTY1 is one of the selected algorithms in the European NESSIE project, and has been among the cryptographic techniques recommended for Japanese government use by CRYPTREC in 2003. "MISTY" can stand for "Mitsubishi Improved Security Technology"; it is also the initials of the researchers involved in its development: Matsui Mitsuru, Ichikawa Tetsuya, Sorimachi Toru, Tokita Toshio, and Yamagishi Atsuhiko. MISTY1 is covered by patents, although the algorithm is freely available for academic (non-profit) use in RFC 2994.

Procedure to run the project:

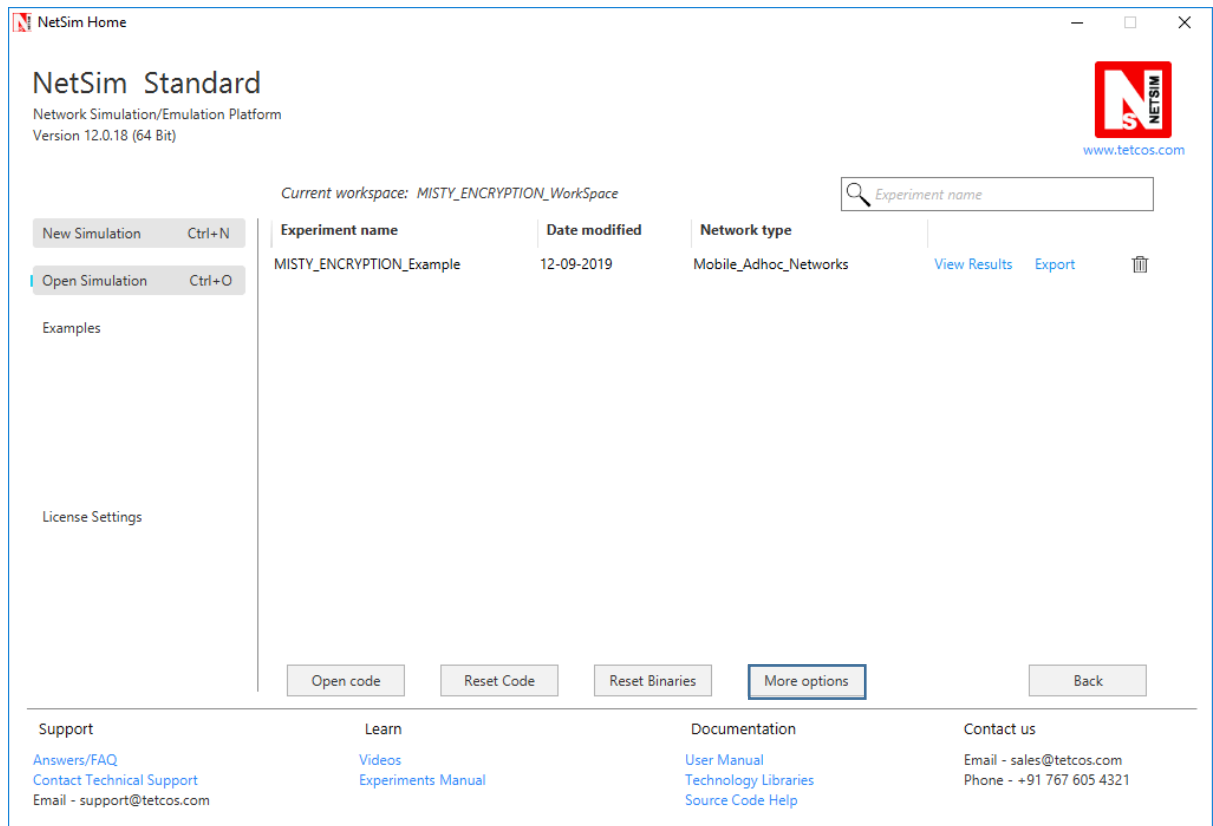

1. After you unzip the downloaded project folder, Open NetSim Home Page click on **Open Simulation** option,

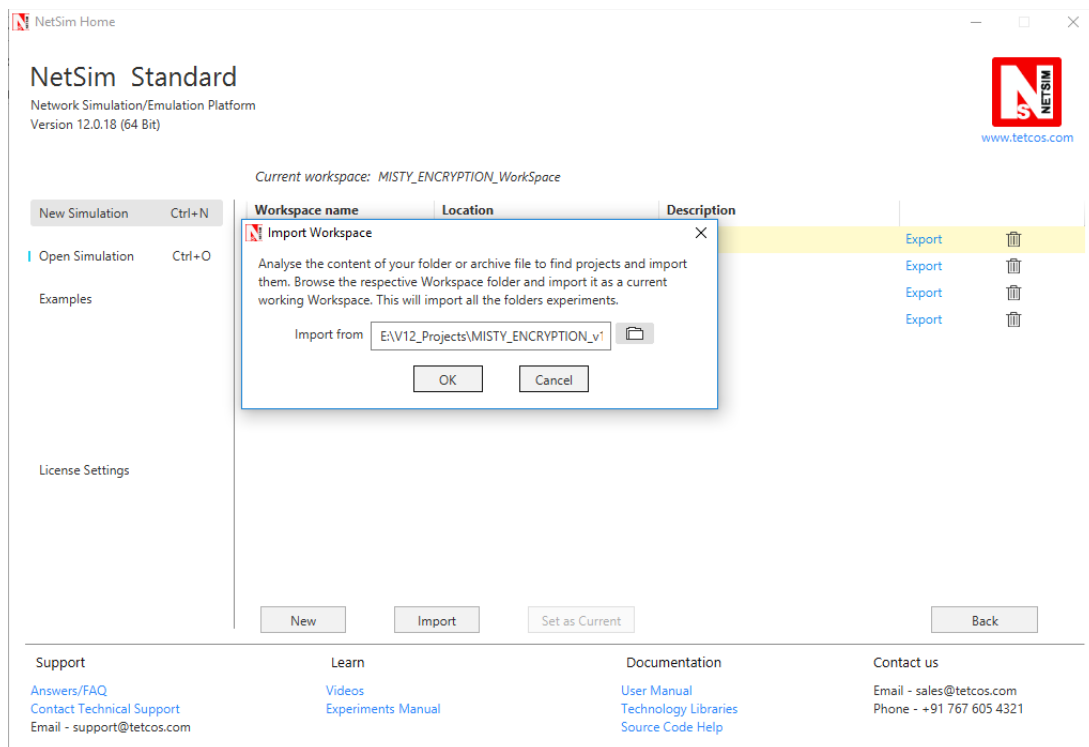

2. Click on Workspace options

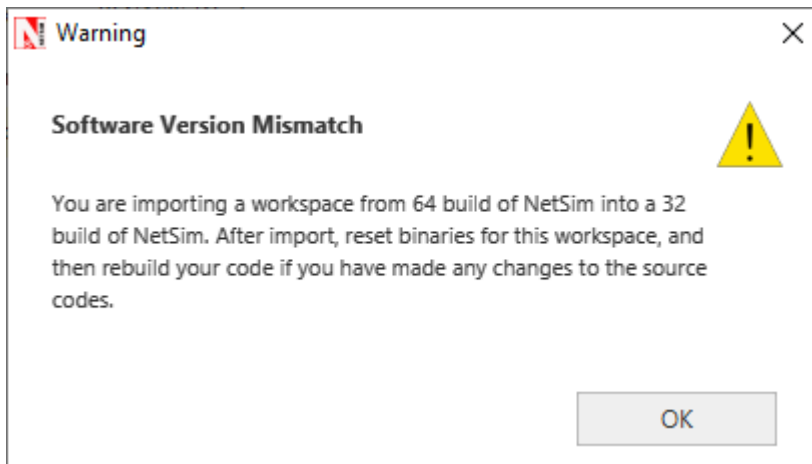

3. Click on More Options,

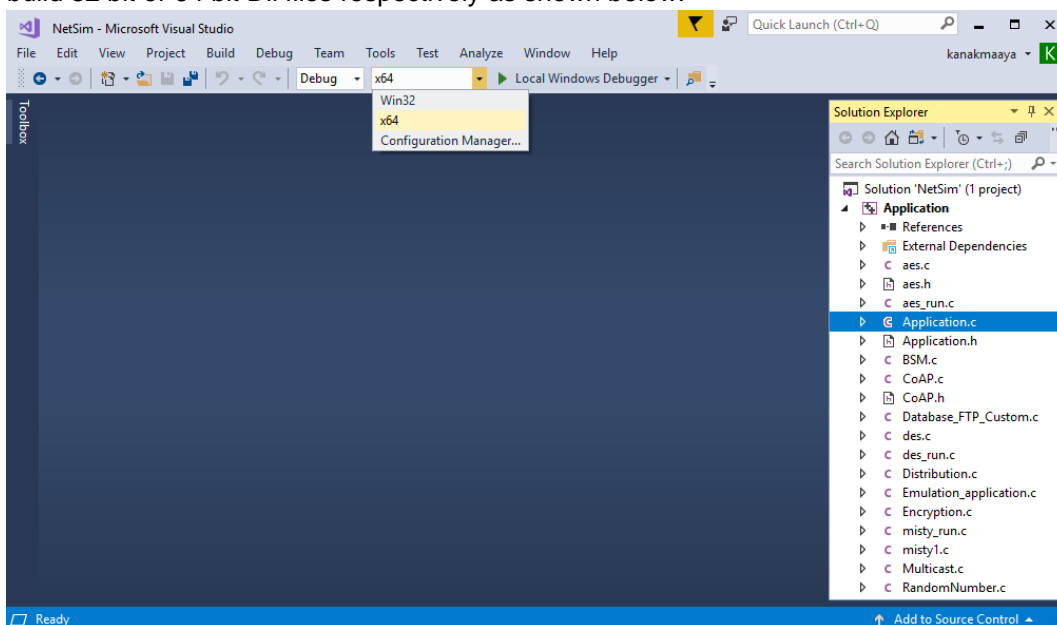

- Click on Import, browse the extracted folder path and go into `MISTY_ENCRYPTION_WorkSpace` directory. Click on Select folder button and then on OK.

- While importing the workspace, if the following warning message indicating Software Version Mismatch is displayed, you can ignore it and proceed.

6. Go to home page, Click on Open Simulation → Workspace options → Open code
7. Based on whether you are using NetSim 32 bit or 64 bit setup you can configure Visual studio to build 32 bit or 64 bit DLL files respectively as shown below:

8. Now expand Application Project and click misty_run.c file. This file contains the following lines of code

```
#include <string.h>
#include <stdlib.h>
#include <stdio.h>
#include "application.h"

void misty_run(char* str, int* len)
{
    int n;
    int l = *len;

    unsigned char buf[32];
    unsigned char key[32];

    for (n = 0; n < *len; n += 16, str += 16, l -= 16)
    {
        /* Set the plain-text */
        memcpy(buf, str, min(16, l));
    }
}
```

```

        misty1_main(buf);
        memcpy(str, buf, 16);
    }

}

```

In the `misty_run()` function inside the `misty_run.c` file we pass the plain text in parts of 16 bytes each time to get it encrypted. This is done because the crypto algorithm accepts a 16 byte plaintext as input. Here the variable `str` contains the packet payload and `len` corresponds to the size of payload in bytes.

9. Modifications that were done to the source codes of the Application project is explained below:

a) Addition of `#include<application.h>` and `#define uint8 unsigned char` to the beginning of the file (shown in red).

- i. `#include <stdlib.h>`
- ii. `#include <string.h>`
- iii. `#include "application.h"`
- iv. `typedef unsigned long u4;`
- v. `typedef unsigned char byte;`
- vi. `#define MISTY1_KEYSIZE 32`
- vii. `#define uint8 unsigned char`

b) Removed inline keyword that is present before the functions `fi()`, `fo()`, `fl()` and `flinv()`.

```

inline u4 fi( u4 fi_in, u4 fi_key){ ... }

inline u4 fo(u4 *ek, u4 fo_in, byte k){ ... }

inline u4 fl(u4 *ek, u4 fl_in, byte k){ ... }

inline u4 flinv(u4 *ek, u4 fl_in, byte k){ ... }

```

To

```

u4 fi( u4 fi_in, u4 fi_key){ ... }

u4 fo(u4 *ek, u4 fo_in, byte k){ ... }

u4 fl(u4 *ek, u4 fl_in, byte k){ ... }

u4 flinv(u4 *ek, u4 fl_in, byte k){ ... }

```

c) Now go to the `main()` function in the file and check that line `#ifdef TESTMAIN` was removed or commented before the `main()` function and also the associated `#endif` at the end of the `main()` function.

d) `main()` function was renamed to `unsigned char* misty1_main(uint8* input)`

```

unsigned char* misty1_main(uint8* input)
{
/*
Key:          00 11 22 33 44 55 66 77 88 99 aa bb cc dd ee ff
Plaintext:    01 23 45 67 89 ab cd ef fe dc ba 98 76 54 32 10
Ciphertext:   8b 1d a5 f5 6a b3 d0 7c 04 b6 82 40 b1 3b e9 5d
*/

u4 Key[]= {0x00112233, 0x44556677, 0x8899aabb, 0xccddeeff};
u4 Plaintext[]= {0x01234567, 0x89abcdef, 0xfedcba98, 0x76543210};
u4 Ciphertext[]= { 0x8b1da5f5, 0x6ab3d07c, 0x04b68240, 0xb13be95d};
u4 ek_e[MISTY1_KEYSIZE], ek_d[MISTY1_KEYSIZE];
u4 c[4];

```

- e) Commented the declaration of Cipher text, Modify the declaration of Plaintext variable, as shown below:

```

u4 Key[]= {0x00112233, 0x44556677, 0x8899aabb, 0xccddeeff};
u4 Plaintext[4];
//u4 Ciphertext[]= { 0x8b1da5f5, 0x6ab3d07c, 0x04b68240, 0xb13be95d};
u4 ek_e[MISTY1_KEYSIZE], ek_d[MISTY1_KEYSIZE];
u4 c[4];

```

- f) Now check the commented lines starting from misty1_keyinit() to misty1_key_destroy() as shown below:

```

misty1.c
Application (Global Scope)
283  /* misty1_keyinit(ek_e,Key);
284  misty1_encrypt_block(ek_e,&Plaintext[0],&c[0]);
285  misty1_encrypt_block(ek_e,&Plaintext[2],&c[2]);
286
287  if (!memcmp(c,Ciphertext,4 * sizeof(u4))) {
288  printf("Encryption OK\n");
289  }
290  else {
291  printf("Encryption failed[0x%08lx 0x%08lx 0x%08lx 0x%08lx]\n",
292  c[0],c[1],c[2],c[3]);
293  exit(1);
294  }
295
296  misty1_keyinit(ek_d,Key);
297
298  if (memcmp(ek_e,ek_d,MISTY1_KEYSIZE*sizeof(u4))) {
299  printf("Internal Error keysch is wrong\n");
300  exit(1);
301  }
302
303  misty1_decrypt_block(ek_d,&Ciphertext[0],&c[0]);
304  misty1_decrypt_block(ek_d,&Ciphertext[2],&c[2]);
305
306
307  if (!memcmp(c,Plaintext,4 * sizeof(u4))) {
308  printf("Decryption OK\n");
309  }
310  else {
311
312  printf("Decryption failed[0x%08lx 0x%08lx 0x%08lx 0x%08lx]\n",
313  c[0],c[1],c[2],c[3]);
314  exit(1);
315  }
316  */

```

- g) Addition of the following lines of code just above the misty1_key_destroy(ek_e); statement as shown below:

```

// Memcpy is used to equate input which is Char to Plaintext
// which is Unsigned Long

memcpy(Plaintext,input,2*sizeof(u4));
memcpy(&Plaintext[2],&input[8],2*sizeof(u4));

```

```

misty1_keyinit(ek_e,Key);
misty1_encrypt_block(ek_e,Plaintext,&c[0]);
misty1_encrypt_block(ek_e,&Plaintext[2],&c[2]);

memcpy(input,c,2*sizeof(u4));
memcpy(&input[8],&c[2],2*sizeof(u4));

```

```

// Mmcpy is used to equate input which is Char to Plaintext
// which is Unsigned Long

memcpy(Plaintext,input,2*sizeof(u4));
memcpy(&Plaintext[2],&input[8],2*sizeof(u4));

misty1_keyinit(ek_e,Key);
misty1_encrypt_block(ek_e,Plaintext,&c[0]);
misty1_encrypt_block(ek_e,&Plaintext[2],&c[2]);

memcpy(input,c,2*sizeof(u4));
memcpy(&input[8],&c[2],2*sizeof(u4));

misty1_key_destroy(ek_e);
misty1_key_destroy(ek_d);
memset(Key,0,4 * sizeof(u4));

```

- h) Inside the misty1_main function the above codes were modified to ensure that the plaintext is properly initialized with the 16 bytes of payload received, for the encryption to happen.
- i) Here, memcpy() is done initially to equate input received as which is char, to the plain text which is unsigned long.

```

memcpy(Plaintext,input,2*sizeof(u4));
memcpy(&Plaintext[2],&input[8],2*sizeof(u4));

```

- j) After the calls to misty1_encrypt_block() memcpy() is done to equate the encrypted cipher text back to the input.

```

memcpy(input,c,2*sizeof(u4));
memcpy(&input[8],&c[2],2*sizeof(u4));

```

10. Now double click on the application.c file and make a call to misty_run() function instead of the call to aes256, inside the copy_payload() function as shown below (changes are marked in red):

```

if(info->encryption==Encryption_TEA)
    encryptBlock(real,payload,&key);
else if(info->encryption==Encryption_AES)
{
    misty_run(real,payload);
    //aes256(real,payload);
}
else if(info->encryption==Encryption_DES)
    des(real,payload);

```

11. Right click on Solution in Solution Explorer and select rebuild solution

12. Upon rebuilding, libApplication.dll will get created in the bin_x86/ bin_x64 folder.

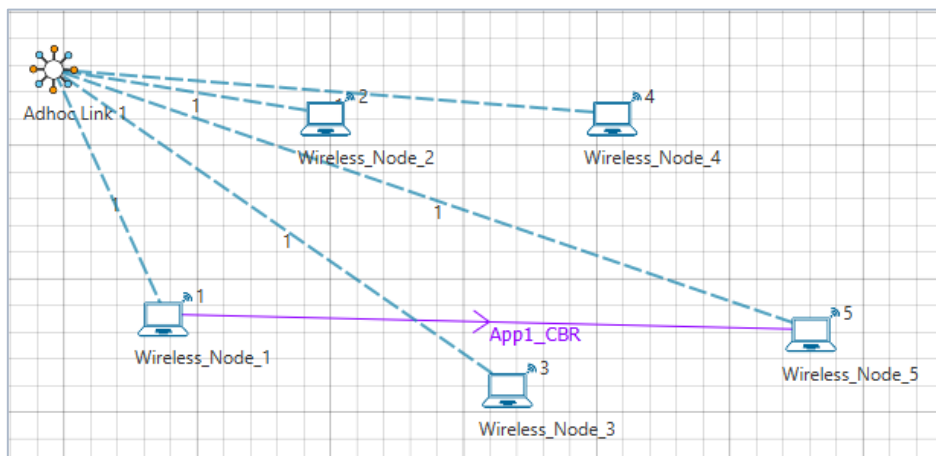

Note: While using NetSim 64-bit setup, users need to change solution platform as x64

```

1 #include <string.h>
2 #include <stdlib.h>
3 #include <stdio.h>
4 #include "application.h"
5
6
7 void misty_run(char* str, int* len)
8 {
9     int n;
10    int l = *len;
11
12    unsigned char buf[32];
13    unsigned char key[32];
14
15    for (n = 0; n < *len; n += 16, str += 16, l -= 16)
16    {
17        /* Set the plain-text */
18        memcpy(buf, str, min(16, l));
19        misty1_main(buf);
20        memcpy(str, buf, 16);
21    }
22
23
24
25
26

```

13. Open **Configuration.netsim** file from the zip and make sure that AES encryption is selected in the application properties.

14. Also Wireshark option has to be set to either Online or Offline in any of the nodes where AES256 encryption is enabled.

15. Now misty1 codes will be running instead of AES256.

16. You can see the encrypted payload in Wireshark either during simulation if online is set or after the simulation if offline is set.

17. Setting Wireshark to either online or offline will give you Packet Capture metrics where links to .pcap files are provided. The number of links available depends on the number of nodes in which Wireshark is enabled.
