

# Channel Notching in Cognitive Radio Networks

**Software:** NetSim Standard v13.3, Visual Studio 2022

## Project Download Link:

[https://github.com/NetSim-TETCOS/CR\\_Channel\\_Notching\\_v13.3/archive/refs/heads/main.zip](https://github.com/NetSim-TETCOS/CR_Channel_Notching_v13.3/archive/refs/heads/main.zip)

Follow the instructions specified in the following link to download and setup the Project in NetSim:

<https://support.tetcos.com/support/solutions/articles/14000128666-downloading-and-setting-up-netsim-file-exchange-projects>

## Introduction

In Cognitive Radio networks, the secondary user (CR CPE) actively senses for the presence of the primary user (Incumbent). If the CR\_CPE detects the primary user, then UCS(Urgent Co-existence Situation)Notifications will be sent by the secondary user to the base station. UCS notifications are generated at the end of the quiet period. Upon receiving the UCS notification BS(Base-Station) checks for possible interference between Primary and secondary users. If interference is detected, secondary users vacate the channel and will be moved to a different vacant channel if available.

Channel Notching basically allows the primary and secondary users to co-exist in the same channel. This is achieved by allowing the secondary users to use the free sub channels which are not occupied by the primary users, as compared to the standard case (without channel notching), where the entire channel is blocked even if some of the sub channels of that channel are being used by the Incumbent.

Hence, in cases where there are limited available channels, using Channel Notching will help in achieving higher throughput and channel utilization.

**Note:** Channel notching code will work only for a single Channel, single CR-CPE and for at-most one Incumbent.

## Example

1. The **Channel\_Notching\_Workspace** comes with a sample configuration that is already saved. To open this example, Go to Your work in the Home screen of NetSim and click on the **Channel\_Notching\_Example** from the list of experiments.
2. The saved network scenario consisting of 1 Wired Node,1 router, 1 Base-Station and 1 CR\_CPE in the grid environment. Application Traffic is configured from CR\_CPE to the Wired node.

**Figure 1:** Network Topology in this Project

3. Go to Base-stations Properties > Interface\_2(Cognitive-Radio) > Datalink-Layer

Base-Station Properties	
Operating_Frequency_Start(MHz)	55
Operating_Frequency_End(MHz)	56
ON Duration(s)	10
OFF Duration(s)	0
Keepout_Distance(m)	500

Table 1: Base station properties in Data-Link layer

4. Run the Simulation for both the samples and check the results.(by Enabling and Disabling CHANNEL\_NOTCHING in Source Code)

**Note:** If the NetSim Simulation Console window halts at Packet Trace completed, terminate the simulation manually by pressing Ctrl+C.

Enabling and Disabling CHANNEL\_NOTCHING Steps mentioned in Appendix

**Results and discussion:** The throughputs obtained from result dashboard.

Samples	Throughputs (Mbps)
With channel notching	0.002949
Without channel notching	0.000000

Table 2: Different cases with throughputs

## Appendix: NetSim source code modifications and steps.

1. Open the Source codes in Visual Studio by going to Your work-> Source Code and Clicking on Open code button.
2. In the Solution Explorer, Go to **Cognitive Radio > 802\_22.h** and open it.
3. If you want to enable Channel Notching, Uncomment (if commented) **#define \_CHANNEL\_NOTCHING\_**

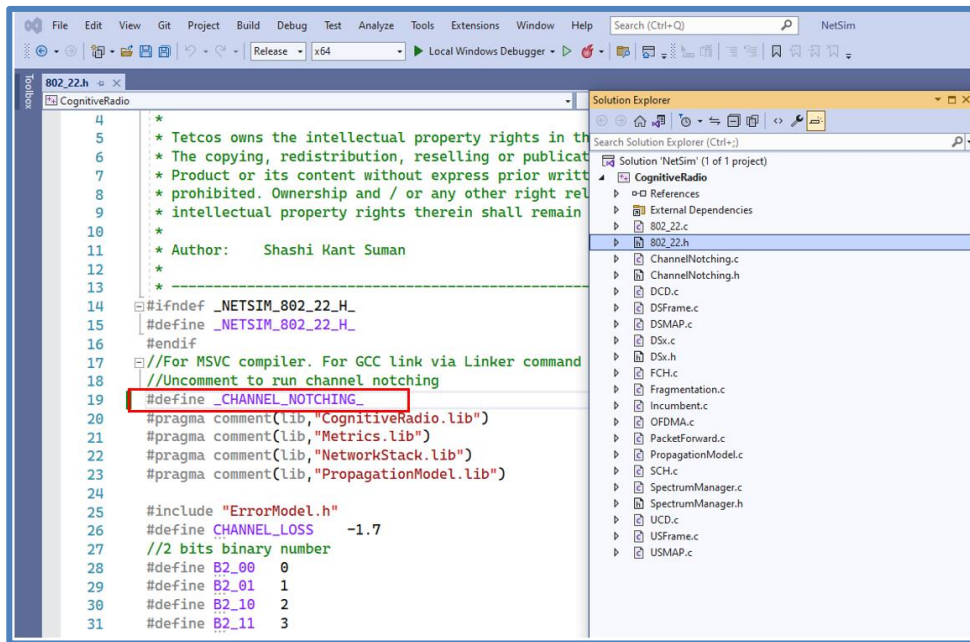

Figure 2: Comment/Uncomment Channel Notching code

4. If you want do disable Channel Notching, comment **#define \_CHANNEL\_NOTCHING\_**
5. Right click on Solution Explorer-> Rebuild project.
